Presented by

# Software-Controlled Switched Reluctance Motors

Caton Mande

R&D Engineer

UC Davis Western Cooling Efficiency Center

## Background

- Power savings can be achieved by reducing the indoor fan speed when possible
- Induction motors are typically used to drive RTU indoor fan and are designed to operate at a fixed speed
- Variable frequency drives (VFDs) are used to provide variable speed fan operation
- Switched Reluctance Motors were tested as an alternative to induction motor + VFD system

# Induction Motors

- Primary components:
  - Stator (stationary part)
  - Rotor (rotational part)
  - Wire windings (create electromagnetic poles on stator and rotor)
- Speed passively controlled by AC power frequency
- VFD changes the AC power frequency, but adds losses to the VFD/motor system

# Switched Reluctance Motors (SRM)

- Primary components:
  - Stator (stationary part)
  - Rotor (rotational part, stacks of ferrous laminate material)
  - Stator wire windings (create electromagnetic poles)
  - Software-controlled inverter
- Inverter actively controls stator coil commutation and current - inherently variable speed
- Less transistor losses

---- Magnetic Field

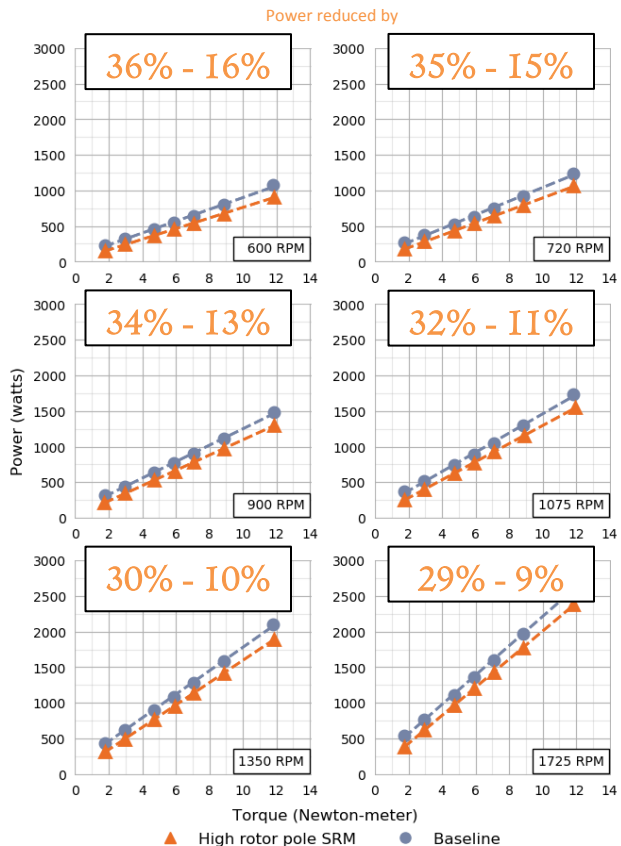

(R) Rotor

(St) Stator

## Testing Methodology

- **Laboratory testing**
  - 3HP high rotor pole SRM and 3HP induction motor + VFD
  - Each motor tested on a benchtop dynamometer at six different speeds and seven different loads
  - Each motor tested in laboratory RTU at seven different airflows and three different airflow resistances
- **Field testing**
  - 10-ton RTU on a big box retail store in Corona, CA between November 1, 2017 and August 31, 2018
  - 3HP high rotor pole SRM and 3HP induction motor
  - High rotor pole SRM performance was measured in two phases:
    - Fixed speed- matching the baseline induction motor RPM
    - Variable speed- using the manufacturer's recommended speeds

## Benchtop Testing

## Lab RTU Testing

### Power Intensity reduced by

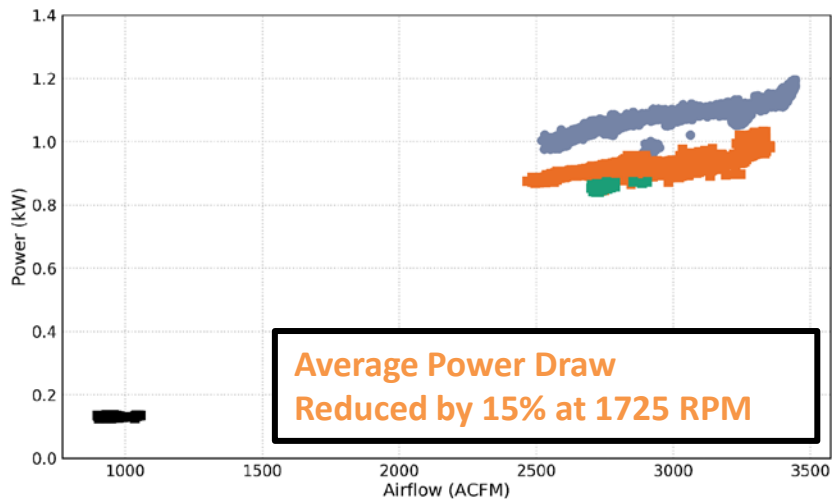

30% - 10%

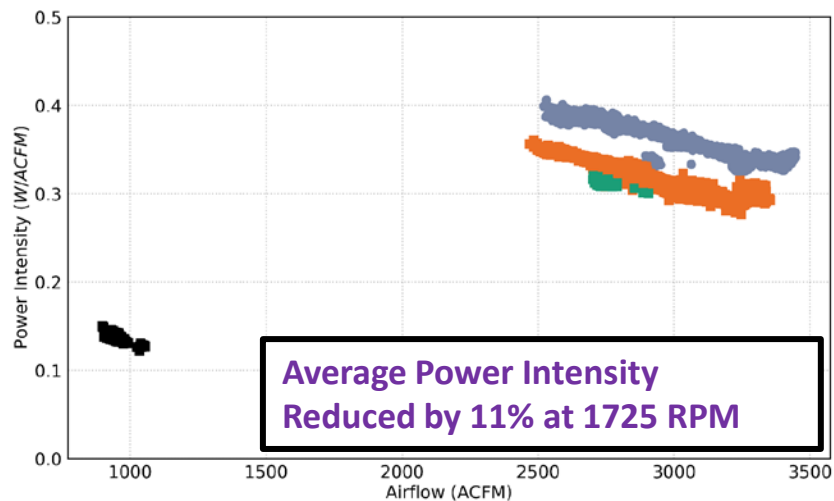

35% - 14%

36% - 16%

## Field RTU Testing

- Baseline (1725 RPM)
- High rotor pole SRM (1294 RPM)
- High rotor pole SRM (1725 RPM)
- High rotor pole SRM (690 RPM)

- Baseline (1725 RPM)
- High rotor pole SRM (1294 RPM)
- High rotor pole SRM (1725 RPM)
- High rotor pole SRM (690 RPM)

**Reducing the Fan Speed Provided Additional Savings**

This project was funded by the California Emerging Technologies Program.
